

## What Does Coronavirus Mean for Markets Longer Term?

Just over a week after various U.S. stock market indices set new all-time highs, the market entered correction territory defined by a loss of 10% or more. During the slide, the S&P 500<sup>i</sup> suffered its biggest two-day combined loss since August 2015 on February 24th and 25th, with losses again accelerating on February 27th after pausing on the 26th. Since the start of the year, commodity prices are down 10% and oil prices are down nearly 20% on concerns over global growth. Yields on 10-year Treasury notes, one of the best risk-free assets, have tumbled in recent weeks to historic lows because investors have flooded into them, driving up prices.

The speed and severity of the decline clearly reveals deepening concern over the prospects of a global pandemic, and markets normally overreact to conjecture or rumors before settling on actual facts. While fears of the COVID-19 coronavirus drove markets down in late January, equity markets originally recovered quickly as sentiment turned more positive, believing fears were overblown.

More recently, the surge of coronavirus cases outside China has dramatically heightened worries that the epidemic will more dramatically slow global growth given increasing business closings and increasing travel restrictions.

The impacts are potentially substantial. Some U.S. companies claim that they could lose as much as half their annual revenue from China if the COVID-19 coronavirus epidemic extends through the summer. Analysts report that U.S. businesses may generate no earnings growth in 2020 if the virus becomes widespread.

*Even if the virus is contained fairly rapidly, or dissipates in the spring, disruptions to global supply chains may take several months to fully reset.*

Even if the virus is contained fairly rapidly, or dissipates in the spring, disruptions to global supply chains may take several months to fully reset. Business confidence in the U.S. has also turned decidedly more negative in recent weeks.

While markets were a bit rattled by cases in Italy and South Korea, markets reacted much more sharply to reports that cases were spreading beyond just a few countries, multiplying supply chain impacts. Germany, Europe's largest economy, is

rushing to limit the spreading coronavirus impact which is hitting its already weak economy by further damaging supply chains heavily dependent on China and Italy. Within Germany, and other European nations as well, the number of confirmed infections is growing representing a direct internal threat. Increasing numbers of events have been cancelled and pressure to act more stringently is growing. Threats of quarantine combined with fears of the actual disease could increase the economic impact of the disease. In the U.S., the Centers for Disease Control (CDC) also warned that the spread to the U.S. was inevitable stating it's "When", not "If" it arrives. More recently, some concerns have arisen that the virus could potentially even push the U.S. into recession, although current projections as of February 27 predict only a slowdown in first quarter to a 1% annual growth rate.

World Health Organization has stated the number of confirmed cases in epidemics typically rise sharply for eight to 10 weeks before peaking. Coronavirus is a bit more concerning because it is particularly contagious, and its long incubation period makes early detection difficult. As a result, infections spread more easily, and containment is more difficult, and it would seem wise to expect a somewhat longer and more widespread impact.

Still, while the impact on individual lives can and will be tragic, at a societal level, the longer-term impact should be minor. In Italy, through February 26th, of the 400 people with the COVID-19 coronavirus, all 12 that died were elderly people with pre-existing health conditions. Overall, the mortality rate of the disease is estimated at

<sup>i</sup> The S&P 500 Index is a market capitalization weighted index of the 500 largest U.S. publicly traded companies.

March, 2020

about 2%, although rates are much lower outside of China. Not surprisingly, the majority of deaths are suffered by those that typically succumb to the flu, the old and very young. According to the CDC, about 36,000 people die from the regular flu every year, which has a typical mortality rate of 0.1%. By contrast, the Bubonic plague is estimated to have killed approximately half of the European population and Spanish Influenza of 1918 inflicted its highest mortality rate on those aged 20-40 often within hours of contracting the disease. The COVID-19 coronavirus, as awful as it is, appears to represent nothing close to these events.

Economic growth may be stalled or delayed to some degree, but the planet should not suffer a global death rate that significantly alters societies or economies. As countries adjust and move forward, supply chains may revert mostly back to normal, and growth should resume, even it takes some time to ramp back up.

U.S. residents have further cause for optimism. The U.S. economy is best positioned among the 20 largest economies in the world to withstand the coronavirus shock. Corporate America remains strong, the lower tax environment continues to trickle down through the economy, and the favorable monetary policy could likely continue at least through 2020. Profits for U.S. businesses are near cyclical highs and productivity has improved markedly in the past year. The U.S. unemployment rate remains at a 50-year low, and incomes are growing at the fastest rate in a generation, particularly at the lower end. Consumers are strong, and lower leverage combined with low interest rates result in less dollars applied to servicing consumer debt. Sales of new homes hit a 12 ½ year high in January. More recently, even trade policy has been turning more positive. Notably, the U.S. health-care system is also better

equipped than most other nations to combat a nationwide outbreak, and we have the geographical advantage of two oceans as neighbors.

Before coronavirus, U.S. stocks were already expensive carrying rich valuations while facing moderate economic growth prospects that many expected to slow, presenting a difficult market for U.S. equities in 2020. The stage was set for a market correction, and an unusually tragic cause has delivered one. Circumstances, however, also suggest that the pullback is “only” a correction that should not morph into a long-lasting full-fledged melt-down. The U.S. economy is strong and stable, and the global economy had been picking up speed. Damage should be temporary rather than permanent, and if history repeats it suggests that a slowdown will be followed by a sharp rebound. Bolder investors may want to look for buying opportunities, but it’s probably too early for assuming the worst for markets is behind us. As the disease increasingly impacts the U.S. and the globe, people may react unpredictably, and continued volatility in the markets seems very likely until a clearer direction for the disease and its impact emerges.

**Investors should carefully consider the investment objectives, risks, charges and expenses of the Fund before investing. Wildermuth Advisory, LLC is an SEC-Registered Investment Adviser that advises the Wildermuth Endowment Fund. Investing in the Fund involves risk, including those summarized below. An investment in the Fund is generally subject to market risk, including the loss of the entire principal amount invested.

The value of your investment in the Fund at any point in time may be worth less than the value of your original investment, even after taking into account any reinvestment of dividends and distributions.

You should consider the shares to be an illiquid investment. Even though the Fund will make periodic repurchase offers to repurchase a portion of the shares to provide some liquidity to shareholders, only a limited number of shares will be eligible for repurchase by us. You should carefully consider that you may not have immediate access to the money you invest for an indefinite period of time. An investment in our shares is not suitable for you if you need immediate access to the money you invest. Certain investments in the Fund are illiquid making it difficult to sell these securities and possibly requiring the Fund to sell at an unfavorable time or price. The value of certain Fund investments, in particular no-traded investment vehicles, will be difficult to determine and the valuations provided will likely vary from the amounts the Fund would receive upon sale or disposition of its investments.
